

Get to know these labels your life depends on it!

A cancer-causing agent (carcinogen)

Materials causing skin corrosion/burns or eye damage on contact

Flammable materials or substances liable to self ignite when exposed to water or air

Substances, such as poisons and highly concentrated acids possible death on contact

Why are we still allowing the use of these products in our homes and expose yourself and our families to them every day?

90% of all the surface sealers that are used in Australia have these, one or all these warnings, but are not shown openly in most of the cases by the seller or even on the package. Only in the Safety Data Sheets (for the people who actually ask for the right papers) can you see the truth.

The vast majority of sealers that are used by applicators, contractors, builders etc., will have one or all of the warnings but because the application of the product might be faster, cheaper or simply fall into the 'don't care' box; they will be used in preference to the better safer eco products in the market.

One of the old reasons manufacturers could give you a 10-20 yrs warranty (some of them would not even go past 5 yrs in real life...) on product was because they used highly volatile chemicals that lasted that long and will stay a long time in the environment our kids rooms our homes and work places...

Look at some of the names where one or all of the labels are hidden in their fine print! **Go ECO now!**
